Insights At a Glance

Key takeaways from the data.

Turning insights into impact.

01 Revenue is Strong but Unevenly Distributed

Looking at the revenue numbers, the business brought in **$298.6M** across **85,410 trips** which is impressive. However when you break it down by driver, the gap between the top performers and the bottom ones is quite significant. Joseph Jones alone generated **$2.63M** while some drivers barely crossed **$1M**. This tells me the business is heavily dependent on a small group of high performing drivers and that is a risk worth paying attention to.

02 Late Deliveries Are Happening Too Often

The current on-time delivery rate of **55.7%** indicates that delivery delays are occurring too frequently. This level of performance can negatively affect customer satisfaction and long-term retention.

Improving scheduling efficiency, driver accountability, and route optimization should be a top operational priority.

03 Fuel is the Biggest Cost Threat

Fuel cost the company **$95.6M**, which is **32%** of everything the business earned. In simple terms, for every **$100** made, **$32** went to fuel alone. The trucks average **6.50 miles** per gallon across **85,000 trips**. If drivers made small changes like avoiding unnecessary idling and maintaining steady speeds, the savings across that many trips would add up to millions. Fuel is the one cost in this business that drivers can directly influence every single day.

04 The Fleet is Working Hard but Maintenance Bills Are Climbing

The fleet utilization rate is at **83%**, which means the trucks are almost always on the road. That is a good thing for business. However, the maintenance bill tells a different story that **$5.7M** was spent across **2,920** service records. What stands out is that preventive maintenance, repairs, and tire replacements are all costing roughly the same amount. This suggests the company is waiting for things to break before fixing them, rather than catching problems early. A stronger routine maintenance schedule would reduce unexpected breakdowns, keep trucks on the road longer, and ultimately save the company money.

05 Safety Incidents Are Costing the Business Money

There were **170 incidents** recorded, resulting in **$2.65M** in claims. Out of those, **54** were the driver's fault meaning they could have been avoided. Equipment damage was the most expensive category, costing **$741K** alone. Simple steps like proper pre-trip vehicle checks and regular driver training would go a long way in cutting these numbers down. At the end of the day, **$2.65M** walking out the door in avoidable claims is money the business should be keeping.
